

# Personal DJI account sync for AEROLOG

Prepared for the AEROLOG owner and development team • 6 September 2026

## The answer

Personal DJI account cloud synchronization exists, and a documented commercial API is available to implement it. Flight Reader is the clearest route found. My earlier conclusion that contacting DJI was the only way forward was too strong. The missing dependency for this route is a Flight Reader API account and key, followed by a real-account compatibility test; it is not another DJI parsing key. [Flight Reader API documentation](#)

This research concerns downloading a pilot's existing DJI cloud flight history into AEROLOG. It distinguishes that from uploading local phone/controller files, decoding TXT logs, and connecting enterprise equipment through FlightHub. No account was purchased, password transmitted, or real flight downloaded during this investigation.

## Evidence that apps really do this

**FlyFreely** explicitly names Flight Reader as its third-party processor for automated DJI Fly cloud-log collection. Its guide describes converting existing DJI cloud accounts to that provider while preserving the existing workflow. This is strong evidence of a working integration in another operations application, although it does not prove AEROLOG has identical commercial rights. [FlyFreely integration guide](#)

**Dronedesk** describes exchanging DJI credentials for an access token, then retrieving cloud logs matching a job's date and location. It also describes matching aircraft and batteries by serial number. It does not publish its underlying DJI protocol. [Dronedesk help](#)

**AirData** directly describes downloading GO, Fly and Pilot logs from DJI cloud after the pilot synchronizes them in the flight app. This is account retrieval, not merely a file-upload feature. [AirData Direct DJI Sync](#)

DJI's own guides confirm account-based cloud synchronization for Fly/GO 4 and separately for Pilot/Pilot 2. Your understanding was substantially correct. Shared DJI login alone does not establish that every app, model, region and historical record will be retrievable through one third-party connector. [DJI Fly and GO 4 guide](#) • [DJI Pilot guide](#)

Confidence: high that a documented integration route exists; unverified for your actual account and fleet until an authenticated test succeeds.

## The documented implementation route

Use HTTPS to [api.flightreader.com](https://api.flightreader.com) with a server-side Bearer secret. The published contract has three relevant operations:

1. POST `/v1/accounts/dji` exchanges DJI email/password for an account ID.
2. GET `/v1/logs/{id}` enumerates cloud logs; Limit and CreatedAfterId support bounded incremental retrieval.
3. GET `/v1/files/flight-logs/{id}/{filename}` retrieves an original TXT file.

The vendor says credentials are retained only in memory during the exchange. This is its claim, not an independent security audit. Account IDs can become invalid after a DJI password change. [API contract](#)

The release history records introduction of cloud enumeration in August 2023 and continued work through August 2026. The latest download fix returns 404 for an unavailable or changed-password account; general documentation describes 401 invalidation. The connector should offer reconnection for confirmed invalidation and distinguish a missing file from a broken connection. May 2024 notes recommend the ID cursor over the older timestamp cursor to avoid omitted logs. [Flight Reader release notes](#)

## Cost and obtaining access

Prices checked on 6 September 2026 are USD. Pay As You Go has no monthly fee and costs \$0.02 per billable request. Premium costs \$59 per month, includes 10,000 requests, and charges \$0.005 per additional request. The vendor emails API access information after signup. An API plan is the relevant product; the desktop log viewer is a different purchase. [Flight Reader API plans](#)

**Illustrative cost, not a quote:** at 1,000 billable requests/month, Pay As You Go is \$20 versus \$59 Premium. Their simple break-even is 2,950 requests/month. Count requests rather than flights: list polling, authentication, downloads and optional provider processing affect usage. Retries and tax can add cost. These calculations use the published rates; actual request counts must be measured.

## Commercial and data handling points

Flight Reader's May 2025 terms explicitly exempt API use from its restrictions on automated processing and bulk third-party log processing. General restrictions on distribution or sale of the service or resulting data remain, and no SLA is offered. Obtain written clarification for AEROLOG's intended multi-organization SaaS/OEM use before commercial rollout. This is a contract question, not proof that integration is prohibited. [Flight Reader terms](#)

The connection screen must name Flight Reader as the processor receiving the initial DJI credentials. Keep its secret key on the server. For AEROLOG, I recommend retaining the provider account handle securely and discarding the DJI password after connection.

## What remains uncertain

**Account and regional coverage.** DJI disabled cloud record synchronization for US operations starting in June 2024 and explains that records generated during visits to the US are also affected. A cloud connector cannot recover files that never reached the cloud or were deleted. Do not infer this account's eligibility from the computer's Dubai timezone. [DJI regional notice](#)

**Direct DJI access.** English and Chinese searches of official developer/support material did not yield a public personal-history authentication and download contract or a confirmed mandatory partner entitlement. That is a documentation gap, not evidence that the API does not exist. The existing Open API key is documented for parsing files. [DJI parsing library](#)

**Historical technical leads.** Synacktiv's original 2020 investigation identified DJI flight-profile and overview routes. Credential-free checks on 6 September 2026 returned a parameter error and a not-logged-in response, respectively. They establish route presence, not a working authentication/download integration. The previously tried unofficial v1 flight-list route returning 404 did not justify ruling out other routes. [Synacktiv analysis](#)

**Alternative platforms.** FlightHub 2 has an organization API; it is not a prerequisite for the personal-account route above. AirData's own API documentation restricts competing-service use, so its API should not be assumed to be a permitted backend for an AEROLOG clone. [FlightHub 2 OpenAPI](#) • [AirData API terms](#)

## Recommended AEROLOG implementation

This is an engineering proposal, not functionality already delivered. Build a provider adapter for Flight Reader with connect, disconnect, sync status, retries and incremental checkpoints. Associate the connection with the authenticated pilot and make the target organization explicit. Preserve source identifiers and original files so repeat synchronization cannot add duplicate flight time. Resolve aircraft and batteries by serial number and send unmatched equipment for review.

Download originals and initially reuse AEROLOG's existing parser. If fleet compatibility fails, assess Flight Reader's processing service separately. Never infer unavailable battery telemetry. Before enabling unattended sync, test history completeness, late uploads, reconnect after password changes, duplicate prevention, member access revocation and organization isolation.

**Next required input:** a Flight Reader API secret key from an API plan, plus agreement to use that named processor for the initial account connection. We can implement against the documented contract without waiting for a DJI support reply. Production readiness still requires a successful account test and the commercial clarification above.

Research stopped after primary documentation, a named production integrator, current pricing and recent release notes converged on an actionable route. Negative findings about direct DJI access remain bounded. No authenticated account test was performed.
